Java coding test for experienced

Core Java Online Test Each set having 20 questions and time duration 25 minutes. Core Java Online Test JDBC Online Test Servlet Online Test JSP Online Test Hi all, I'm working as an instructor at Tech Lead Academy. We teach programming for Software Development Engineer in Test(SDET) position. I have gathered the most asked interview coding questions from my own interview experience and from our student's interviews. I'm sure if you work through these coding questions, you can nail most of the coding interview questions for SDET. For Big O notation time complexity, please read this article.1. String reverse. Write a method that will take one string as an argument and will return the reverse version of this string.2. Arra reverse. Write a method that will take an array as an argument and reverse it.3. Reverse words. Write a method that will take a string as an argument. The method will reverse the position of words and return it.4. String palindrome. A palindrome is a word, phrase, number, or sequence of words that reads the same backward as forward.5. Number palindrome. A palindrome is a word, phrase, number, or sequence of words that reads the same backward as forward. The straight forward solution would be to convert number to string and use the above approach. Some interviewers will not allow to do it. So let's take a look at what we can do here.6. Max/min number from an array. Write a method that will accept an array of int as an argument and it will return the max/min number from a given array.7. Find the second min/max number from an array. Write a method that will accept int array as an argument and return second or n min/max number from the given array. I will go with the sorting algorithm. Arrays.sort() is using mergesort and it's the time complexity is logarithmic (n log n). Some interviewers don't like it when sorting is used. It's possible to do without sorting, using nested loops and we will end up having O(n²).8. Static keyword in Java. The static keyword is a very popular question in the interviews.What's a static keyword in Java?- Static variables and methods belong to the class, not to a specific object. We need to use static members by class name.Let's see an example, what's output from the below program? Why this output?9. String Pool and == operator to compare references in Java. Let's see an example, what's output from the below program? Why this output?10. Swap values of two variables without direct reassignment and without creating any extra variables.11. Two string anagram. An anagram is when all the letters in one string exist in another but the order of letters does not matter. Write a method that will accept two string arguments and will return true if they are anagram and false if they are not.12. Remove duplicates from a string. Write a method that will accept one string argument and return it without duplicates. We will see two versions of this method.13. Count letters(Map). Write a method that will accept a string as an argument. The method will count the number of appearances of each char and return map. The key will be a letter and the value will be a number of appearances in the string. See input and output in the example.14. FizzBuzz. Print numbers from 1 to 100- if a number is divisible by 3 print Fizz- if a number is divisible by 5 print Buzz- if a number is divisible by both 3 and 5 print FizzBuzz.15. Even or Odd. Write a method that will accept one int as an argument. The method will print Even if the number is even and Odd if the number is odd.16. Sum. Write a method that accepts int[] array and an int number, find 2 elements in the array that sum is equal to the given int. Assume that an input array will have only one pair of numbers that sum equal to our given number. It will always have this pair. See input and output examples. I will use the Brute Force algorithm. If you have a better algorithm, please put it in the comments. I will be happy to see it.17. The Fibonacci. It is a series of numbers where the next number is the sum of the previous two numbers. The first two numbers of the Fibonacci is 0 followed by 1. Write a method that will accept one int number n. The method will print n number of Fibonacci numbers.17.1 Balanced String. This question became very popular lately. The program should find out if an input string is balanced or not.Congrats! You made it. It was a long list. Thank you! Java developer Junior QA developer Frontend developer Full-stack Java developer Junior Java developer Middle Java developer Senior Java developer Java tests use RealLifeTesting™ so you can assess each applicant's knowledge of Java coding in a controlled environment. DevSkiller Java coding questions provide you with a clear understanding of an applicant's coding ability and problem-solving skills. Key features DevSkiller Java coding questions provide you with clear insight into each applicant's specific skillset Remote testing saves you time and money RealLifeTesting™ methodology offers a greater user experience where candidates can use their own IDE, clone to GIT, run unit tests, and access Stack Overflow/GitHub/Google for research. The latest anti-plagiarism tools ensure reliable results Clear, precise results that non-technical professionals will easily understand Java coding tests available for all levels of experience Skills covered in our Java interview questions and online tests Springboot Java QA Selenium MongoDB Mavern Explicit Wait Kotlin REST What to look for in a Java developer Java is a compiled, object-oriented programming language. It is intended to let application developers "write once, run anywhere," meaning that compiled Java code can run on all platforms that support Java, without the need for recompilation. However Java is not considered the easiest programming language to use for non-programmers, so you will want to hire the right Java developer for the job. It is important to understand that the Java world evolves quickly so your ideal candidate will need to have up to date, relevant experience. Your Java developer will need to have an understanding of Java language through collections, "streams" and lambda expressions and concurrency through thread pools. They should have knowledge of frameworks including Spring Boot 2, Hibernate and SQL, JUnit, and Spock among others. As well as the language itself, your Java developer will also need to have knowledge of the tools and libraries of the language, such as Maven and Gradle, Git, and Docker – this will pay dividends in time-saving further down the line. Finally, your Java Developer should have hands-on, practical experience of working on actual coding projects, be it commercial or otherwise. Build your own custom Java Coding Questions Do you want to test our Java Coding Questions using your own codebase? No problem. The DevSkiller online task wizard is stacked with awesome features that allow you to customize your test invites. Choose the languages you want to test, define the test scope, and duration all while monitoring your applicants' process in real-time. Remote testing means you can conveniently test your applicants and find the best talent from all corners of the globe. Interested but want to know more about our Java online tests? If you think DevSkiller might be just what your business needs, but you want to be sure, check out the case study below: Ada Health Ada Health is a global health company founded by doctors, scientists, and industry pioneers to create new possibilities for personal health. The company previously screened tech skills through an on-site task, followed by a team interview- a procedure that required a great deal of time. For this reason, the biggest objective Ada had was an improved interview experience that would save time. "DevSkiller helped us to save precious on-site time for applicants that are already likely to be a fit. We're saving 3 hours per candidate – that was the time we spent with applicants on a technical task before." Micha Gerwig– Engineering Manager Ada Health Frequently asked questions How are Java online tests evaluated? With our Java online tests, once the candidate has completed the test, the results are automatically evaluated and presented in a clear and concise way. You don't have to be technically minded to understand them. Each candidate is evaluated based on the solutions they have provided, with each candidate being assessed based on whether their solution would work, the quality of the code, and any errors in the code. In addition, extra features test for plagiarism from previous tests. How do candidates take a test? DevSkiller's Java online tests are accessible from anywhere, meaning all the recruiter has to do is provide the test, then it is up to the candidate to come up with the right results. Each test can be made accessible for a limited time. Candidates can complete tests using their favorite IDE and then clone the project to GIT. Candidates can also run unit tests to make sure their solutions are effective. Once completed, test results are automatically evaluated and presented to the recruiter in the form of a report. How long does it take to set up DevSkiller? DevSkiller provides an extensive library of Java coding tests, meaning you can start testing candidates immediately after setting up your account. The whole process of setting up your Java coding questions can take as little as five minutes. What do candidates think of DevSkiller tests? Feedback received from candidates is that they love the structure of DevSkiller Java coding tests. We find candidates like having a chance to prove their software development skills, rather than simply trying to churn out old algorithms that they haven't touched since they were students. They also like that DevSkiller tests use normal coding practices and conventional tools like unit testing and cloning to GIT from a personal IDE. If developer candidates are apprehensive about taking the test, their suspicions usually come from experience taking algorithmic tests- tests that don't monitor the actual skills a developer uses on an everyday basis. With DevSkiller online tests, we find that candidates can immediately tell the difference and can test their Java coding skills in a way that is challenging but also a fair representation of the type of work they will be doing. What's the test duration? Java coding tests are flexible and you can set the duration to suit your own preferences. You have the option to use the default settings, or to cater the test to your own needs. Furthermore, each individual question within a test, can also be set with time-limits. java coding test questions for experienced
