LOVING TO LEARN ASSOCIATION "Holistic Wellness and Health" Health, Education, and Social Service: Crisis Intervention/Life Empowerment (323) 73-LIGHT Appointments (323) 402-0422 Loving to Learn Online Store "Over 300 Low Priced, Quality Products" Your Holistic Wellness: Spirit, Body and Mind TIME IS RUNNING OUT! If you have a Zmodo camera that won't connect to Wi-Fi there's a quick fix. Usually the issue with Internet connection is related to the frequency the camera is operating at. When your router works at 2.4Ghz and 5Ghz, the Zmodo camera can associate itself to the wrong SSID (wireless signal name). But you can fix that. So your Zmodo camera is offline and the first thing you usually notice is that there's no Internet connection. You need to check your WiFi router. If the Zmodo camera doesn't connect to the wi-fi router, there's no way you can have access to the video stream through the Internet, so you need to make sure the camera can associate itself with your router. A Zmodo camera can operate within the frequency of 2.4Ghz and some models can also operate within the 5Ghz. Make sure which model you are using. Some models such as the Zmodo EZcam 720 HD wireless can only operate at the 2.4 Ghz and sometimes that's the reason it gets stuck when associating with the router that works with both frequencies. If your router has both frequencies available and is using the same SSID (name of the signal your devices can associate with) the Zmodo camera can get confused. How to solve the Zmodo Wifi connection problem? To solve the problem with the Wi-fi connection, just follow the steps: Access your wireless router settings. Look for the wireless settings menu. Find the wireless signal name (SSID). Rename the SSID for the 2.4Ghz and 5Ghz (use different names). Open the security tab and make sure your router is using WPA or WPA2. Let's say for example you have a Zmodo EZcam 720 HD that works only with the 2.4Ghz frequency but your router works with 2.4Ghz and 5Ghz frequencies. Just rename the router SSID signal to MySignal-2.4 and MySignal-5 for example. Now that you have the SSID with different names just go your Zmodo camera and start the connection process again and choose the correct Wi-fi SSID. When using the WPA or WPA2 for Wi-Fi security it's necessary to enter a password to connect to the router. That's something universal. The issue with some Zmodo cameras is that they allow you to type a maximum of 13 characters for a password, so if your router uses a long password it won't work. Unfortunately, the solution is to change the router password. I know you probably won't like the idea, but it is what it is. So, go ahead and just change it. And that's the solution to your Zmodo camera offline problem. Please share this information with your friends. Try the following connection options in iSpy or Agent to connect to your Zmodo IP camera. If an FFmpeg option is available we recommend you try that first as it will often be faster and include audio support. You can also try the VLC plugin if the FFmpeg option isn't working. The settings for Zmodo cameras are built right into our free surveillance software - click "Add" then "IP camera with wizard" to automatically setup your Zmodo cameras. Remember to also try connecting via ONVIF as Zmodo cameras may support ONVIF connections as well. Start typing in the "Make" box to find your camera. If your camera is not listed then click "Get Latest List" in settings or when on the add camera wizard. If you need to modify the URL, then add or edit the Zmodo camera and you can modify the connection type and URL in the video source dialog (button is top of the first tab). I have a ZMODO camera that worked well, once. I connected it to my internet and it worked fine. After which I went to a new location and could never get it to work. In an attempt to connect there, I deleted it from the ZMODO app to force it to re-enter the setup stage to connect it to a new network. Needless to say the ZMD SAP wifi network never showed up to connect to. Now, 3 months later, I was trying my hand at it again. Basically, I turn the camera on. The green light blinks. I follow the steps here: I go to my app while the green light blinks. I open the "add new device" option, it tells me to connect to the ZMD SAP wifi and takes me to my wifi options when I go to continue... but ZMD SAP never shows up. I tried hitting the reset button... holding it for ten seconds, holding it for 20 seconds, hitting it 10 times in a row. It always goes solid green after, and then blinks green, but ZMD SAP never shows up on my phone, wife's phone, or my ipad... it doesn't exist. I also tried adding it manually and typing in the name as a network to add, but even after adding, it won't find it (of course). Any ideas? Inside the box I found a set of printed instructions on glossy paper, the supplied camera unit with protective plastic covering the front and rear, a power cable in a plastic bag, and a set of screws and drywall posts for wall mounting.FIRST STEPSThe instructions say to go find and download the Zmodo phone application. As an iOS user, I was able to locate the application quickly in the App Store. It downloaded and installed without any problems. The next step is to create an account, so I signed up using my mobile phone number, created a password, and received a texted pin to my phone that allowed me to complete the simple registration process via the mobile app. So far, so good.CAMERA SETUPThis is an indoor-only camera, so I decided to set this camera up to face my family room and rear sliding door to monitor it through the day and night. I peeled off the protective plastic, unwrapped and uncoiled the power cable, and hooked it up for the first time. Immediately the green light illuminated, letting me know the camera was ready. In the app, I went to add a new device, and followed the on-screen instructions to get this done. As long as I stayed on the same 2.4Ghz network band, I was fine and could get the camera to connect. The camera needed a name and a password, so I set that up too. This was all very straightforward.TEST USAGewith the camera facing my family room and sliding door, I could easily see the entire room with the camera's wide angle of view, by using the phone app to monitor the camera's output. I tested a motion event, and found a video clip stored that showed the event with audio and reasonably clear video. I tried out the two way speaker / microphone function, and found that worked satisfactorily as well. At night, the night vision IR sufficiently lit up the large room allowing me to view any motion events easily. During the day, enough light gets into the room to illuminate any motion events as well.OVERALLFor its intended purpose of monitoring indoors, I'd say this camera does the job. The company offers higher resolution models which may be a better choice if you end up needing to clearly and positively identify someone in the video, but if you're just trying to monitor an area for specific activities, this Zmodo will fit the bill. It was easy to set up and appears to do exactly what it was meant to do - provide a low cost monitoring solution using your existing WiFi and electrical infrastructure.
