I love the beach, and especially rock pools!The water swirls in from the tide, and you never know what creatures it'll bring with it.That great ocean out there is called the Atlantic.It stretches all the way from Europe and Africa, right across to the Americas, and it is up to eight kilometres deep in places!It's one of the five oceans that cover nearly three-quarters of the Earth.The Atlantic, Pacific, Indian, Southern and Arctic.Although the water looks calm and still from outer space, it's always moving in patterns called currents.So the water that swirls around this rock pool has travelled thousands of miles across the globe and so have some of the creatures in it.When ocean currents flow around the planet, they move warm and cold water with them, changing the climate and weather as they go.For example, Britain would actually be much colder if it wasn't for the warm water flowing from the Caribbean.The currents also move anything that happens to be floating in them, which can be sea creatures, ships and unfortunately rubbish.This rubbish is harmful for sea creatures and can be brought ashore on the tides too.And talking of the tide...I think it may be time to move. 1.
