Open spots will be ignored when checking the correct order.Step 3 eÁÁÁ When you have finished arranging the processes and products, click the Check button.Step 4 eÁÁÁ Answer the questions in the journal. Just as the cost of turning a water turbine is paid for by water flowing downriver, the cost of pumping protons is paid for by electrons flowing from higher-energy states to lower-energy states. Similarly, complex III is ready to accept electrons on the basis of electron flow to complex IV, where four electrons and two protons are transferred from cytochrome C (a heme protein) to oxygen (O2), generating water (H2O). In an ATP- and NADPH-dependent process, the adipocyte runs de novo lipogenesis (fatty-acid synthesis) to produce palmitate (a 16-C saturated fatty acid). As you create assignments, you can take problems directly from eBook chapters or sections or from the entire learning objective, which would include all problems. (Credit: Illustration by Carli Hansen) Although it is beyond the scope of this article to cover cell replicative and anabolic pathways, it is important to consider that every cell and tissue make everything in the human body from food using metabolic transformations whose biosynthetic complexities greatly exceed the catabolic complexities of breaking down carbohydrates, fats, and proteins. You might have to move tiles around, like a puzzle, to create adjacent open spots.The correct order should start in the upper left corner. 1). 6 Total oxidation of the fatty-acid portions of triglycerides depends on ÁÁ-oxidation enzymes, the citric acid cycle, and the respiratory electron transport chain. 2 Although the heat aunitnoc sisiIÁculg al arap ocilÁsotic HDAN le ejaixoer euq osecorp nu ne otavurip omoc sairdnocotim sal a otatecaolaxo ed sonobrac ortauc ed sert revloved edeup oticopida IE .onegÁxo odneimusnoc aÁAnitnoc senortcele ed etropsnart ed anedac al .+ PDAN a HDAN a HDAN ed orurdih rirefsnart arap senotorp ed nÁÁiculoved al ed edneped TNN euq a odibeD .elbitsubmoc ed aunitnoc nÁÁicadixo us ed rasep a .avitcuder sisetnÁsoib ed selevin sotla nazilaer euq salul©Ác rop aziminim eS .ad es euq onegÁxo le noc .seracÁza ed amrof ne acimÁuq aÁgrene ne etreivnoc al y .auga y onobrac ed odixÁÁid noc los led aÁgrene al nanibmoc satnalp sal .sisetnÁsotof al etnaruD . sairdnocotim sal ne necudorp es sorto y losotic le ne sodicuder serotcafoc sonugla necudorp es euqrop lairdnocotim osarg odicÁÁ ed nÁÁicadixo al y sisiIÁcilig al ertne ZO ed otisiuqer us ne aidemretni se sodicÁÁonima ed nÁÁicadixo al euq esrala±Aes ebed n©ÁibmatÁ njesnaH ilraC ed nÁÁicartsull .otid©ÁrC(.gif .avitadixo nÁÁicalirofsotf y isen©ÁAgomret .sanarbmem ed s©ÁÁvart a socimÁuqortcele setneidarg ed nÁÁicareneq .SOR ed lairdnocotim nÁÁicacixotised y nÁÁicudorp al a odalucniv ÁÁse .)5 .gif(qjaba aicah ocuder es senortcele sol ed aÁgrene al .alla sÁAm senortcele ed dadinifa anu ed rotpeca nu a aicnerefsnart adac noc 2HQ Ása odnamrof .Q amizneoc al a sodirefsnart senortcele sol noc DAF y + DAN a nabaxoer es 2HDAF y HDAN le .senoiacibu satse nE .VI y .III .II .I sojelpmoc ne soidemretni omoc sodata latem ed srtsulsC .selanoicida sanÁetorp sahcum noc .ZO al y .C omorcotic le .Q amizneoc al a ogeul y .DAF o / y + DAN a oremirp senortcele sol ereifsnart etnemacipÁt elbitsubmoc ed nÁÁicadixo al .+ DAN >DAF >Q amizneoc >C omorcotH >ZO ed odadarged ed nÁÁrtap nu eugis senortcele ed dadinifa al euq a odibeD .omuh ne ebus etnemlaretil aenemihc anu ne elbitsubmoc ed nÁÁicadixo al ed aÁgrene al .alul©Ác anu ne euq aenemihc anu ne setnerefid nos on elbitsubmoc ed latot nÁÁicadixo al ed sotcudorp sol Y á € 'Malate) and generated a NADPH cytosolico for continuous lipogeits (Malate á € pyruvate). In addition, mitochondria have an enzyme called so-called Nucleotide Transhydrogenase (NNT) that can transfer NADH hydride to NADP + to generate NADPH. It flows to the right and then fits again to the left of the next row. 2), living beings create and repair everything that are made, and carry out the work of rest and active metabolism from consuming food. Thus, without O2 as an electron acceptor, the mitochondrial oxidation of the fuel would have to be linked to an electron flow system. In addition, NADPH is used to generate ROS rusts by NADPH Oxidas. The Respiratory Complex integrated in the membrane á € "formed by complexes I, II, III and IV with diffusive NADH á € † NAD +, COENZIMA Q Located in the membrane, FADH2 á € † FAD EMBILIZED and O2 Á Á á € † Diffusible H2OÁ e, is called the respiratory transport chain of electrons. For the coenzyme Q to be ready to accept more electrons of reduced cofactors, electrons must flow to the protein complex III. Unlike a fireplace, whose purpose is to completely burn the fuel to generate heat (Fig. This Last can donate electrons to beta-keto groups and alkenes to perform reducing biosyna. Each of the membrane protein complexes is made up of many Polypects with specifically localized redox-active centers that are intermederiaries in the chain (Fig. 5 The total oxidation of glucose involves the oxidative and non-oxidative phases of the penty phosphate via (not shown) or glucoglysis and cycle of the citric acid linked to breathing. 3 The flow of electrons through the electron respiratory transport chain can generate reactive species of oxygen (ROS). 7 White adipocytes convert glucose into triglycase through Linked redox processes that minimize breathing.
